## **BEST AVAILABLE IMAGES**

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

**IMAGES ARE BEST AVAILABLE COPY.**

**As rescanning documents *will not* correct images,  
please do not report the images to the  
Image Problem Mailbox.**

**IN THE CLAIMS:**

1. (Currently amended) A method for correcting a path sequence of an environment variable in a data processing system, the path sequence specifying an order for searching directories for locating executable code within the data processing system, the method comprising:

monitoring the data processing system for a change effecting the path sequence of the environment variable, wherein the environment variable is enabled and being used by the data processing system to specify the order for searching the directories within the data processing system; and

responsive to detection of the change effecting the path sequence of the environment variable, determining whether any duplicate files exist in any of the directories identified by the path sequence; and

responsive to determining that duplicate files do exist, altering the path sequence of the environment variable to ensure that a proper file is found and used when selected by one of a user and a running application program.

2-5. (Cancelled)

6. (Currently amended) The method as recited in claim 1, wherein the step of altering the path sequence of the environment variable comprises removing references to all but one of duplicate files in the path sequence of the environment variable.

7. (Original) The method as recited in claim 6, wherein the all but one duplicate file is selected by a user.

8. (Cancelled)

9. (Currently amended) A method for correcting modifications that have been made to an environment variable during installation of software in a data processing system, the method comprising:

installing the software on the data processing system for subsequent execution by the data processing system;

detecting that an environment variable has been modified during the installing step;

responsive to the detecting step, determining if duplicate files exist in a path sequence of the modified environment variable;

responsive to a determination that duplicate files exist in a path sequence of the environment variable, prompting a user to select the a correct one of the duplicate files;  
and

removing all incorrect ones of the duplicate files from the path sequence of the environment variable.

10. (Currently amended) A computer program product in a computer readable media for use in a data processing system for correcting a path sequence of an environment variable in the data processing system, the path sequence specifying an order for searching directories for locating executable code within the data processing system, the computer program product comprising:

first instructions for monitoring the data processing system for a change effecting the path sequence of the environment variable, wherein the environment variable is enabled and being used by the data processing system to specify the order for searching the directories within the data processing system; and

second instructions, responsive to detection of the change effecting the path sequence of the environment variable, for determining whether any duplicate files exist in any of the directories identified by the path sequence; and

third instructions, responsive to determining that duplicate files do exist, for altering the path sequence of the environment variable to ensure that a proper file is found and used when selected by one of a user and a running application program.

11-14. (Cancelled)

15. (Currently amended) The computer program product as recited in claim 10, wherein the step of altering the path sequence of the environment variable comprises removing references to all but one of duplicate files in the path sequence of the environment variable.

16. (Original) The computer program product as recited in claim 15, wherein the all but one duplicate file is selected by a user.

17. (Currently amended) A system for correcting a path sequence of an environment variable in a data processing system, the path sequence specifying an order for searching directories for locating executable code within the data processing system, the system comprising:

first means for monitoring the data processing system for a change effecting the path sequence of the environment variable, wherein the environment variable is enabled and being used by the data processing system to specify the order for searching the directories within the data processing system; and

second means, responsive to detection of the change effecting the path sequence of the environment variable, for determining whether any duplicate files exist in any of the directories identified by the path sequence; and

third means, responsive to determining that duplicate files do exist, for altering the path sequence of the environment variable to ensure that a proper file is found and used when selected by one of a user and a running application program.

18-21. (Cancelled)

22. (Currently amended) The system as recited in claim 17, wherein the step of altering the path sequence of the environment variable comprises removing references to all but one of duplicate files in the path sequence of the environment variable.

23. (Original) The system as recited in claim 22, wherein the all but one duplicate file is selected by a user.

24. (Currently amended) A method for managing environment variables in a data processing system, comprising data processing system implemented steps of:

automatically invoking an environment variable manager ~~whenever upon~~ occurrence of at least ~~on one of the following occurring events occur:~~ a) a directory is deleted; b) ~~a product is installed on the data processing system;~~ c) a product is uninstalled on the data processing system; and ~~d) a path sequence of c)~~ a given environment variable is manually modified by a user;

determining, by the environment variable manager, if ~~the any~~ any occurring event a), b) or c) causes a modification to an affected path sequence of any presently active environment variable, the path sequence specifying an order for searching directories for locating executable code within the data processing system; and

~~enabling at least one of a) a correction to~~ automatically correcting the affected path sequence if it is determined that the occurring event causes the modification and b) a display to the user of an interface for informing the user about a need for a correction of the affected path sequence.

25. (Currently amended) A method for managing environment variables in a data processing system, comprising data processing system implemented steps of:

automatically invoking an environment variable manager whenever a path sequence for ~~an~~ a presently active environment variable is modified in the data processing system, wherein the path sequence specifies an order for searching directories for locating executable code within the data processing system;

determining, by the environment variable manager, if duplicate files exist in the directories specified by the path sequence of the environment variable; and

enabling a display of each environment variable determined to have duplicate files in the directories specified by the path sequence to a user for correction.

26. (Currently amended) A method for managing environment variables in a data processing system, comprising data processing system implemented steps of:

determining if a directory, specified by within a path sequence of any environment variable, is manually deleted by a user, wherein the path sequence specifies an order for searching directories for locating executable code within the data processing system; and

enabling at least one of the following: a) an automatic deletion of the directory from the path sequence of the environment variable; and b) a display of an interface to inform the user to delete the directory from the path sequence of any affected environment variables.

27. (Currently amended) A data processing system having means for managing environment variables, comprising:

means for automatically invoking an environment variable manager ~~whenever upon occurrence of at least on one of the following occurring events occur:~~ a) a directory is deleted; b) ~~a product is installed on the data processing system;~~ c) a product is uninstalled on the data processing system; and d) ~~a path sequence of c)~~ a given environment variable is manually modified by a user;

means for determining, by the environment variable manager, if ~~the any~~ occurring event a), b) or c) causes a modification to an affected path sequence of any presently active environment variable, the path sequence specifying an order for searching directories for locating executable code within the data processing system; and

means for ~~enabling at least one of a) a correction to~~ automatically correcting the affected path sequence if it is determined that the occurring event causes the modification and b) a display to the user of an interface for informing the user about a need for a correction of the affected path sequence.

28. (Currently amended) A data processing system having means for managing environment variables, comprising:

means for automatically invoking an environment variable manager whenever a path sequence for ~~an a~~ a presently active environment variable is modified in the data processing system, wherein the path sequence specifies an order for searching directories for locating executable code within the data processing system;

means for determining, by the environment variable manager, if duplicate files exist in the directories specified by the path sequence of the environment variable; and

means for enabling a display of each environment variable determined to have duplicate files in the directories specified by the path sequence to a user for correction.

29. (Currently amended) A data processing system having means for managing environment variables in a data processing system, comprising:

means for determining if a directory, specified by within a path sequence of any environment variable, is manually deleted by a user, wherein the path sequence specifies an order for searching directories for locating executable code within the data processing system; and

means for enabling at least one of the following a) an automatic deletion of the directory from the path sequence of the environment variable; and b) a display of an interface to inform the user to delete the directory from the path sequence of any affected environment variables.

30. (Currently amended) A computer program on a computer readable medium having program code means for managing environment variables in a data processing system, comprising:

instruction means for automatically invoking an environment variable manager whenever upon occurrence of at least on one of the following occurring events occur: a) a directory is deleted; b) a product is installed on the data processing system; c) a product is uninstalled on the data processing system; and d) a path sequence of c) a given environment variable is manually modified by a user;

instruction means for determining, by the environment variable manager, if the any occurring event a), b) or c) causes a modification to an affected path sequence of any presently active environment variable, the path sequence specifying an order for searching directories for locating executable code within the data processing system; and

instruction means for enabling at least one of a) a correction to automatically correcting the affected path sequence if it is determined that the occurring event causes

the modification and b) a display to the user of an interface for informing the user about a need for a correction of the affected path sequence.

31. (Currently amended) A computer program on a computer readable medium having program code means for managing environment variables in a data processing system, comprising:

instruction means for automatically invoking an environment variable manager whenever a path sequence for an a presently active environment variable is modified in the data processing system, wherein the path sequence specifies an order for searching directories for locating executable code within the data processing system;

instruction means for determining, by the environment variable manager, if duplicate files exist in the directories specified by the path sequence of the environment variable; and

instruction means for enabling a display of each environment variable determined to have duplicate files in the directories specified by the path sequence to a user for correction.

32. (Currently amended) A computer program on a computer readable medium having program code means for managing environment variables in a data processing system, comprising:

instruction means for determining if a directory, specified by within a path sequence of any environment variable, is manually deleted by a user, wherein the path sequence specifies an order for searching directories for locating executable code within the data processing system; and

instruction means for enabling at least one of the following a) an automatic deletion of the directory from the path sequence of the environment variable; and b) a display of an interface to inform the user to delete the directory from the path sequence of any affected environment variables.
